CITY OF PORTLAND
2012 CITYWIDE ASSETS REPORT
Status and Best Practices

City Asset Managers Group
Sponsored by the Planning and Development Directors
Bureau of Environmental Services
Bureau of Planning and Sustainability
Bureau of Transportation
Office of Management and Finance
Portland Parks and Recreation
Portland Water Bureau
The City of Portland Bureau of Planning and Sustainability is committed to providing equal access to information and hearings.

If you need special accommodation, please call 503-823-7700, the City’s TTY at 503-823-6868, or the Oregon Relay Service at 1-800-735-2900.

To obtain a copy of this document or more information about this project, please contact:

1. Executive Summary

The City’s physical infrastructure assets include roads, pipes, treatment facilities, parks, buildings and more. What does it take to be steward of these community assets? What will we turn over to future generations? This report compiles data and best practices useful to City bureaus and decision-makers in answering these questions. Understanding the value and condition of assets and current asset management (AM) practices will help City decision makers allocate scarce financial resources to deliver public services.

This report provides integrated information about the City of Portland’s physical assets. It provides a summary of the number of assets, replacement value, condition, and unmet funding needs. Information in the report assists the City’s efforts to ensure infrastructure is in adequate condition and that operation, maintenance, rehabilitation, and development programs are as efficient and effective as possible.

Purpose of Report

This report serves to:

- Provide City staff, policy makers and general public with information needed to make more informed decisions that extend the life of the City’s physical assets and deliver agreed service levels
- Account for the community’s investments and track assets over time — past, present and future
- Relate challenges, progress and future opportunities
- Share best practices with peer communities and infrastructure professionals

This report collects and assembles key data, observations and best practices into a single report. Without this report, interested parties would need to search numerous websites and other sources, and triangulate assumptions and methods. This report leverages asset management expertise, contacts and trainings, through the cross-bureau City Asset Managers Group (CAMG), and enables more effective information exchange and the sharing of best practices within and outside of the City. This report dovetails with bureau-specific reports, City audits and policy reports, and is shared with City Council through the annual budget process.

To develop this report, the City’s infrastructure bureaus collect and analyze data on all City-owned buildings and infrastructure. The bureaus strive to follow internationally recognized asset management principles, and use best practices to develop a coordinated approach to citywide asset management. This approach includes determining key measures, such as the value and condition of infrastructure assets, identifying confidence levels for the information presented and acknowledging when information is not available.

Relation to City Policy and Budget

Policy Development

From a policy perspective, there are three key factors to effectively manage the City’s infrastructure systems: service levels, funding and risk. Service levels and risk management are described as key best practices, in Section 5 of this report. Annual funding gaps, by asset group, are described in Section 4 of this report.

At current funding levels, some of Portland’s infrastructure will continue to deteriorate and bureaus may have to decrease their service levels. Two bureaus, Parks and Recreation (PP&R) and the Bureau of Transportation, lack reliable and stable funding sources to adequately invest in maintaining their assets, which means levels of service will decline and risks will increase by default.

Conservatively, infrastructure bureaus estimate a combined annual funding gap of $266 million per year to maintain existing facilities, address regulatory requirements, and meet service levels. This gap will likely grow for each of the next ten years. New assets often add to ongoing operations and maintenance needs, potentially adding to the funding gap. Some new assets may also replace existing asset functions and add new functionality.

City infrastructure policies are shaped by the recently-adopted Portland Plan, and by the Comprehensive Plan Update (CPU), currently under development. The CPU will set a policy framework for public facilities and services, transportation and development-related activities. The CPU Working Draft Part 1 proposes six integrated goals: equity, prosperity,
education, human health, environmental health and resilience. Staff and the public are discussing draft policies to guide priorities for the investment in and management of infrastructure assets.

City Budget Process

The information contained in this report helps decision-makers make more informed decisions in the annual budget process. This annual report, as with previous versions, was submitted to the Portland City Council as part of the annual budget work sessions (for more information, visit: http://www.portlandoregon.gov/cbo). Service level data is also coordinated with the City Budget Office’s budget mapping exercise.

Recent experience shows that this report informs decision-makers with data and business practices relevant to allocating limited resources. Using expertise of the cross-bureau City Asset Managers Group, bureau directors are assisted in responding to questions from City Commissioners and citizen budget members.

Continuous Improvement

Four City bureaus (Environmental Services, Water, Transportation and Parks) have identified these work tasks:

1. Refine service levels, as needed. Each bureau will guide and determine any changes to its service levels.

2. Improve data collection for high-risk assets, and apply mitigation strategies based on asset risk classification. Eventually, bureaus will refine risk assessment methods. Identify opportunities for bureaus to collaborate on risk assessments and mitigation strategies.

3. Add a report card to future Citywide Assets Reports.

4. Develop bureau and asset-specific templates and application processes, for business case.

5. Apply reliability-centered approach to bureau maintenance. This is a bureau-initiated task.

6. Complete long-term investment profiles, develop tools and methodologies, and develop investment profiles for high-risk assets.

7. Continue bureau consultations in bureau budget advisory committees. Discuss lessons from Citywide Systems Plan and pilots from any bureaus, on community consultation or information.
2. Key Findings

This report cites data and processes for the year ending June 30, 2012. This section answers these questions:

- What does the data tell us about the financial value, physical condition and funding?
- What is the context for bureau data gathering?
- What steps are bureaus taking to improve their business practices, to manage their assets?

Status and Conditions

Highlights from the 2012 data are:

1. The current replacement value of the City’s physical infrastructure is estimated at $30 billion. Current replacement value is an estimate of what it would cost to construct these assets today. It represents substantial investments by several generations of Portlanders. Current replacement value excludes the value of land.

2. At current funding levels, some of Portland’s infrastructure will continue to deteriorate and bureaus may have to decrease their service levels. Two bureaus, Parks and Recreation and the Bureau of Transportation, lack a reliable resource base to adequately fund investments in maintaining assets. By default levels of service will decline, and the risk of failure will increase.

3. Conservatively, infrastructure bureaus estimate a combined annual funding gap of $266 million per year to maintain existing facilities, address regulatory requirements, and/or meet service levels. This gap will likely grow for each of the next ten years.

4. New assets often add to ongoing operations and maintenance needs, potentially adding to the funding gap. Some new assets may also replace existing asset functions and add new functionality.

5. The consistent finding of the City’s citywide asset reports (for years 2002 through 2012) is that a substantial annual funding gap persists.

Asset Management

In 2012, bureaus continued to advance selected business practices. These include:

Transportation created Streets of Citywide Significance (SCS) to prioritize maintenance of transportation infrastructure, with a focus on safety.

Environmental Services updated its performance measures to incorporate levels of service.

Water is working to complete Asset Management Plans (AMPs) for all major asset groups, conduct facility valve condition assessments over a five-year period, and continue efforts on service levels, risk and business cases.

Parks continued to extend the AM program to new classes of assets, including playgrounds, trails and bridges. PP&R initiated a Comprehensive Asset Risk Profiles project to assess general risk exposure for all assets and to prioritize investments. PP&R established a dedicated Asset Management program manager and broadened AM participation across all departments.

These bureaus continued to share their best practices. A two-day training event was held in January 2012, sponsored by Environmental Services and Water. Staff from all infrastructure bureaus of the City, as well as other agencies around the region attended.

An advanced Asset Management course was held in November 2012, sponsored by the Water Bureau. Staff from various bureaus and other agencies also participated.
Ten-year Reflections

Evolution of Data and Practices

The refinement of successive reports were influenced by several factors, including Managing for Results (a citywide focus on the City’s aging infrastructure), City Council asking for more rigorous data, a General Fund capital set-aside process used asset management data to inform budget decisions, the ramping up for green infrastructure efforts to use natural processes to serve as infrastructure, and the sharing of best practices with peer communities.

Continuous improvements consist of more and better data, and the exploration of key asset management concepts through special features in the annual reports. In 2005, data analysis expanded to define terms, apply confidence levels to data points, and add bureau observations. In 2007, bureaus started to report regulatory mandates in the annual funding gap. In 2012, bureaus displayed the annual funding gap in two charts to separately account for capacity improvements.

Between 2002 and 2011, the reported Current Replacement Value doubled. Over time, bureaus generated more and better-quality data, new assets were added to bureau responsibilities, and some values rose with inflation.

The annual reports have featured: a scan of potential funding sources (1 year), measuring affordable housing (a non-owner financial interest, for three years), applying risk to a subset of projects (project examples from capital set-aside process, 1 year), and providing a framework to discuss natural networks as green infrastructure.

In 2009, four City bureaus created a shared asset management work plan with seven work tasks. In 2011, the work plan timeline stretched from 5 years to 10 years. Bureaus affirmed the importance of process improvements, but realized that progress might be slow (with limited resources and competing priorities).

Trends, Challenges and Opportunities

The Planning and Development Directors (the CAMG’s sponsor) see three general policy trends:

- Assets exposed to the elements age and wear out, even with best of maintenance.
- Bureaus are making the best of limited resources, but have a big funding gap.

- The funding gap results in increasing risk of failures, reducing our levels of service and perpetuating longstanding inequities.

There are several challenges to advancing citywide asset management best practices. These include:

- Prioritizing limited resources. As bureaus seek out long-term, cost-effective approaches to service delivery, the community also wants to reduce historic inequities by ensuring all Portlanders receive at least basic minimum services.
- Limited resources to reduce the annual funding gap.
- Challenge of coordinating and communicating across multiple bureaus.
- A steep learning curve, for City staff and decision makers, to understand and apply asset management practices.
- Pending retirements of City staff with hands-on knowledge of how to operate and maintain infrastructure assets (so-called succession planning issue).

Opportunities include:

- Cross-functional teams — the Water Bureau has cross-trained its departments and created asset management as the bureau’s charter. Parks is engaging in cross-functional work teams to assess and quantify the risk of certain assets and to determine priorities for investments. Other City bureaus (BES, PBOT, Parks) have also attended trainings on fundamentals of asset management, and committed to cross-training their departments.
- More shared understanding of infrastructure asset management by decision-makers, managers and line staff.
- Community interest in best value for public services, setting realistic service levels and reducing risk of assets failing. Reducing inequitable access to services is another strong community interest. Process tools, such as Triple Bottom Line and risk assessments, can be calibrated to account for social impacts.
- Extensive contacts with peer communities (especially for utilities) and consultants.

For more details on citywide best practices, see Section 5 of this report.
3. Asset Management Context

Goals

The goal of strategic asset management (AM) is to develop a sustainable asset base that provides appropriate levels of service and responds to social, economic, and environmental needs. Asset management addresses the design and specifications, maintenance, repair, rehabilitation, replacement, acquisition and disposal of assets.

Asset management is a set of industry standard best practices that provides a risk mitigation approach to decision making. It is commonly defined as meeting agreed upon public, customer and environmental service levels, while minimizing life cycle costs at an acceptable level of risk.

Asset management activities are driven by asset deterioration, regulations, and community needs (based on service levels). They will differ for each asset type based on maintenance management techniques, scheduling and priorities of activities, failure modes, treatment options, renewal strategies, equipment and practices, and renewal techniques. However, a whole-of-city approach ensures that the most innovative and cost-effective techniques are employed as each bureau's practices improve. Using this cross-bureau effort will continually improve performance-based information that is available to the public, bureaus, and city leaders as they make choices in the types and levels of service desired.

Asset management informs asset acquisition, maintenance and operations, renewal and adaptation, and asset disposal. It focuses on reliability and the lowest total life-cycle cost to provide desired levels of service.

Applying AM principles and practices will:

- support the efficient delivery of services with assets that are cost-effective, well maintained, accessible, energy efficient and safe;
- improve the ability to make sound business and planning decisions at all levels;
- promote effective use of resources;
- improve bureau support and accountability; and
- improve and coordinate City AM planning across bureaus.

Common elements for managing assets include:

- information systems, such as GIS, CADD and Computerized Maintenance Management Systems (CMMS), that provide data on asset inventories and their condition;
- good documentation of life-cycle costs, and optimum renewal strategies that ensure the lowest life-cycle cost;
- a needs assessment to evaluate current practices, asset risks, and opportunities;
- links between service outcomes, bureau programs, AM plans, and performance measures;
- community engagement to better define desired and affordable levels of service; and
- clear assignment of roles and responsibilities to guide AM efforts.
Drivers

In FY 2001–02, City Council set strategic priorities as part of the Managing for Results exercise. The Council identified the City’s deteriorating physical infrastructure as an immediate strategic priority. It remains a top Council strategic priority.

Other policy drivers (federal, state and local) underscore the importance of the condition of municipal infrastructure in supporting a community’s economic health, active neighborhoods, and environmental stewardship, including:

- State and federal regulations;
- Public Facilities Plan, a long-range, citywide plan which requires a major projects list for use in annual capital budgets;
- Portland Comprehensive Plan;
- The Portland Plan;
- Climate Action Plan;
- Municipal bonded debt covenants;
- City of Portland Budget Manual, which requires bureaus to analyze operations and maintenance costs and savings in new projects;
- U.S. Governmental Accounting Standards Board statements (GASB 34, 42, 48, 49 and 51); and
- Other Council Priorities.

Regulatory Compliance

Regulatory compliance requirements can have major impacts on the management of infrastructure systems and on the resources available for repair and expansion projects. Currently a number of federal, state, and local regulations require additional compliance measures by the City. These mandates vary in compliance requirements, timeline, and level of funding through current City revenues.

Regulatory mandates affect all of the City’s infrastructure systems, including sewer and stormwater, transportation, water, parks and civic facility investments. The following represent some of the major regulations on capital systems:

- Clean Water Act, such as the Long Term Enhancement Rule (LT2) and CSO Amended Stipulation and Final Order;
- Environmental Protection Act, including Superfund cleanup requirements;
- Safe Drinking Water Act, including Underground Injection Control requirements;
- Endangered Species Act, such as Habitat Conservation Planning;
- Americans with Disabilities Act;
- Uniform Building Code, including minimum seismic standards; and

Many of these regulations do not have dedicated funds set aside for compliance measures. Compliance often requires significant capital investment, which may require diverting financial resources from capital repair and rehabilitation projects. In addition to existing mandates, future regulations may further impact management of the City’s infrastructure systems.

Bureau funding gaps presented in this report include varying degrees of regulatory compliance. Certain requirements, such as ADA accessibility and building code improvements may occur as part of capital repair or rehabilitation projects.
4. Citywide Asset Status and Condition

This section discusses key citywide data, bureau profiles and bureau methodologies. Several appendices support this status and condition analysis, and define terms. The City Asset Managers Group continues to seek opportunities to more closely align methods across bureaus.

A. Key data

The annual citywide assets reports cite three key measures of the health of infrastructure systems. The measures are: current replacement value, current condition, and annual funding gap. This report breaks each of these measures by bureau and asset group. Confidence levels are assigned to each data point, to communicate the relative quality of the data. In some cases, data is not available or is pending more detailed data collection and analysis.

- **Current replacement value (CRV)** — This is the total cost to replace the entire asset to meet current accepted standards and codes. CRV represents past investments of Portlanders in the City’s transportation, water, environmental service, parks and civic facilities. At critical points in Portland’s history, the community has supported major investments — to deliver drinking water from Bull Run (using headworks treatment, conduits and storage reservoirs), to treat water (using sewer pipes and two sewer treatment plants), to improve access for people and goods (by paving streets and accommodating pedestrians and bikes), to provide safe places to play (with landscape plantings, recreation buildings and features), and to provide civic facilities and technology services (including police and fire facilities).

  The City’s physical infrastructure has a current replacement value of $29.9 billion. By bureau, the infrastructure value is: PBOT ($8.1 billion); BES ($12.5 billion); Water ($7.1 billion); Parks ($1.0 billion); and Management and Finance ($1.2 billion).

- **Current condition** — This is the physical condition of the asset, used to assess its rate of deterioration and remaining useful life. Bureaus set priorities for inspecting the condition of assets, and potential high-risk assets may get priority. Methods range from actual field condition assessment, to staff estimates (based on repair history), to deterioration or failure rate curves. Some assets (like closed-system water pipes) are typically assessed by age and type of pipe, break history and spot excavations.

  Other assets can be inspected directly, but may be dispersed (as with parks buildings, recreation features, trails, benches and other furnishings).

- **Annual funding gap** — This is the difference between the funding needed to address infrastructure needs of an asset at a defined condition or level of service, and the funding that is currently available. It is the amount of money needed to eliminate the backlog and/or maintain the asset to achieve its optimal useful life. There are three types of funding gap:

  - **Repair, Rehabilitation, Replacement (R/R/R):** Additional funding necessary to repair, rehabilitate and replace existing assets to bring them up to current service levels, or replace assets considered obsolete.
  - **Mandate:** Additional funding necessary to improve existing assets to meet regulatory requirements, exclusive of improvements that fall under Repair, Rehabilitation, Replacement or Capacity.
  - **Capacity:** Additional funding necessary to address existing inequities and deficiencies in levels of service for current customers and citizens.

In Appendix 3, there are charts and data sheets for each bureau’s total funding gap, their funding gap by type (with capacity split out) and compared to their annual budgets (capital and operating). The bureau observations piece, below, describes each bureau’s approach to asset management, recent experiences and improvement priorities.

Unfunded federal mandates and external funding of capital projects add to the number and type of physical assets. Although primarily built with leveraged funds, these assets become a long-term City obligation to maintain and operate. Typically, there is little or no set-aside funding for ongoing operating or maintenance of these assets prior to their construction.
For 2012, the key citywide measures did not significantly change from the prior year. New in this year’s report is a breakout funding gap chart for capacity improvements (Appendix 3.b). Bureaus decided to discontinue the future (10-year) asset condition table, since data confidence levels were very low for many asset groups.

**Sustainable Funding Levels**

This year, the combined annual funding gap for Transportation, Environmental Services, Water, Parks and Civic assets is $266 million, including street pavement. A persistent funding gap is the result of under-investing in capital maintenance. This is not a sustainable business practice. With this trend, we can expect lower levels of service and more frequent system failures.

**Past Responses**

In 1996, City Council increased the General Fund capital set-aside, from a base of $3 million, with the intent to add $1 million to it each year until a $10 million set-aside pool was formed. That fund rose to $7 million in FY 2002–03, and then declined after a series of annual budget cuts to an amount insufficient to meet ongoing needs. The General Fund capital set-aside funded a variety of maintenance, replacement, and improvement projects. Major funded projects included ongoing replacements of fire apparatus, ongoing street lighting improvements, renovation of the Hillside Community Center, major maintenance of the 800 MHz system, purchase of a bomb robot, funding of debt service for the Gateway Child Receiving Center and Streetcar #7, and funding of several Parks maintenance projects and acquisitions. In FY 2008–09, City Council redirected the capital set-aside to fund the Public Safety Systems Revitalization Project.

The Auditor’s 2002 report Managing for Results identified the deteriorating physical infrastructure as a priority. That report recommended that City Council consider a Major Maintenance Fund to increase the investment in capital maintenance. City Council did not act on that recommendation.

In January 2007, the Directors’ group reviewed key findings of this report, and asked staff to prepare ideas to 1) start closing the annual funding gap, and 2) more fully maintain existing infrastructure. The City Council must balance many competing demands. This effort will take a number of years. The concept is to build a funding gap finance plan, with a planning horizon of 10 to 15 years.

In 2007, the City Asset Managers Group worked with Financial Planning to improve the General Fund Capital Set-Aside allocation process. The revised process used a new set of criteria based on the risk management process (see Appendix 5 of the City of Portland Asset Status and Conditions Report, December 2007). The risk rating process allows ranking of projects based on how effectively they reduce the risk of the high and extreme risk assets. Use of the citywide risk management process is on hold, pending more feedback and direction.

City Council adopted revised Financial Policies effective July 1, 2008. A new provision stated that at least 25 percent of General Fund discretionary revenue that exceeds the budgeted beginning balance (adjusted) will be allocated to infrastructure maintenance or replacement in the fall budget monitoring process (BMP). The percentage calculation will be based on any discretionary funds in excess of the budgeted beginning balance, adjusted for the difference in encumbrances carried over from the prior year. Infrastructure maintenance projects to be considered for funding will be projects requested but not funded in the prior year’s budget and projects that are underway but still require funding.

There have been mixed results since this provision was enacted. There was no surplus in beginning balance (FY 2009–10) resulting in no additional General Fund capital allocations. In FY 2010–11, City Council allocated $2.4 in Capital Set-aside funding for infrastructure maintenance or repair.
B. Transportation

Profile

The Portland Bureau of Transportation (PBOT) manages transportation assets with a replacement value of over $8 billion. Improved streets, the sidewalk system, bridges, traffic signals (signal hardware), and streetlights make up 93 percent of the dollar value ($7.8 billion). In addition to these key assets, the City of Portland owns other assets that ensure the safety and movement of people and goods: streetcars; an aerial tram; various support facilities; traffic calming devices; signs; parking meters; parking garages; pavement markings; bikeways; guardrails; retaining walls; the Harbor Wall; stairways; and traffic signal computer controllers. These assets are worth $610 million.

Asset Management Approach

Transportation utilizes asset management as a way to effectively and efficiently allocate resources, measure performance, and track infrastructure needs. PBOT’s Asset Management Advisory Committee (which includes engineers and operations staff as well as maintenance, finance, and information technology managers) sets the priorities for asset management within the bureau and helps implement those priorities into business practices.

Asset Management Achievements

Condition Monitoring — Transportation currently conducts condition monitoring on pavement, bridges, structures, street lights and traffic signal infrastructure. PBOT is working with engineers and technology staff to expand condition monitoring to guardrail and traffic signs. Condition monitoring will allow PBOT to plan for appropriate preventive maintenance, rehabilitation or replacement needs and budget accordingly.

Risk Assessment — PBOT is in the process of conducting a risk assessment for failure of assets. Criteria for assessing consequences and likelihood of failure have been created and are being applied to transportation assets. A risk registry, identifying failure modes and assigning risk of failure will be created.

Asset Levels of Service — Levels of service for each infrastructure asset class have been established to track and monitor performance and outcomes achieved. Performance measurement is a way of monitoring progress toward a result or goal. It is also a process of gathering information to make well-informed decisions.

An Infrastructure Asset Report Card summarizes achievement of the levels of service.

Asset Management Priorities

Streets of Citywide Significance (SCS) was created as a way to prioritize how Maintenance Operations crews do the work to maintain the infrastructure. SCS are travel corridors PBOT prioritizes for expenditures due to their high traffic volume across all modes (freight, transit, motor vehicles, pedestrians and bicycles). Safety is a key element that factors into the SCS designation. The prioritization is necessary because the scope of resources needed to maintain transportation infrastructure greatly exceeds resources available.

Asset Value and Condition

Maintaining and operating the transportation infrastructure are key activities of PBOT. Emerging needs include:

Street Lighting — Street lights are important for the safety of our neighborhoods and for those who use the transportation system. Many of the city’s 55,000 street lighting luminaries were replaced in the early 1980s when mercury vapor lights were converted to high pressure sodium lamps. PBOT is currently working with City Council to implement a program for conversion to LED lighting.

Signals — Traffic signals are made up of several components (i.e. hardware, software, mast arms, controllers, cabinets and signals). Approximately 46 percent of the traffic signals are in poor or very poor condition. Traffic signals in poor condition are more prone to increased trouble calls, causing safety and congestion problems. Traffic signals in optimal condition provide efficient movement of people and goods and when synchronized reduced greenhouse gases.

Pavement — Approximately 40 percent of the collector and arterial system is in poor or very poor condition, 21 percent is fair and 39 percent is in good or better condition. In 2009, City Council passed a policy to eliminate paving work on local streets. This means that approximately 60 percent of the pavement system will not receive preventive maintenance or rehabilitation.
**Bridges** — Of the 160 bridges the city owns, 29 percent are either structurally deficient or functionally obsolete; 29 of these are in poor or very poor condition including 25 that are weight restricted. Weight restrictions on bridges impact the ability to move freight and goods, which ultimately has an impact to our economy. Additionally, freight has to find alternate routes, extending travel time requiring the use of more fuel and impacting the environment.

**Sidewalk Network** — ADA required the City’s public facilities be designed and constructed so that they are accessible to all people, including those with disabilities. Ten percent of the sidewalk system in Portland has corners with ramps that meet current ADA-accessible standards. In total, 45 percent of corners have accessible corner ramps, which met both current and past ADA standards.

**Annual Funding Gap**

The funding gap is defined as the amount of additional funding and resources needed to bring or restore an existing asset class to a fair or better condition and to maintain it at that condition. This includes preventive maintenance, rehabilitation and replacement needs.

Transportation’s maintenance liability continues to increase as the infrastructure ages.

PBOT’s primary source of discretionary funds is not keeping pace with inflation, meaning the purchasing power has decreased. This means PBOT has had to make reductions to the budget, resulting in the ability to do less preventive and routine maintenance. This will have a severe impact on the future condition and continued decline of Transportation’s infrastructure.

PBOT’s annual $140.8 million funding gap breaks out as follows:

**Streets** — The funding gap is estimated at $40 million for collector and arterial streets; another $35 million for local streets. Ratings of collector and arterial streets have been completed. Calculations of need are based upon assigned treatment rules, which are based upon pavement condition, road type and road usage.

**Sidewalk system** — $13.9 million is needed annually to repair, restore or replace curbs to bring them to a fair or better condition and $9.3 million is needed annually to build ADA accessible corners, where there are currently none, and maintain the corners in a fair or better condition. While the sidewalks are owned by the City, it is the adjacent property owner’s responsibility.

**Bridges** — The total cost to replace city-owned bridges in poor condition, and address bridge deficiencies is $12.7 million annually.

**Signal Hardware** — A total increase of $18.9 million per year is needed in capital funding.

**Street Lights** — $5.5 million per year is needed to improve the lights to a fair or better condition. This need may change with the conversion of street lights to LED lighting. PBOT is currently working with City Council to implement a program for conversion to LED lighting.

**Other** — Unmet need for pavement markings, street signs, streetcar, traffic signal controllers, other equipment, and retaining walls and stairways totals $5.5 million.

**Calculation Methodologies**

**Replacement Value**

By using the average unit cost at a network level, the Portland Bureau of Transportation (PBOT) uses a simple approach in calculating the replacement value for its assets. For an asset, the replacement value includes the costs of removal and installation. Overhead is included in the replacement value. This is consistent with how PBOT capitalizes overhead at year-end on infrastructures for two accounts, improvements (closed projects) and work-in-progress (open projects). Transportation uses the overhead methodology based on labor for most of the assets, except for bridges and other structures that were based on the total costs overhead methodology, since additional work is needed. Efforts continue to improve the information on the inventory count and replacement values on some of the transportation assets. Please note that actual replacement costs would vary by location.
**Current Condition**

Condition methodology is reported as a percentage of the total number of assets. The methodology for determining asset condition varies by asset group, see below.

**Annual Funding Gap**

Total unmet need is defined as the amount of additional funding and resources needed to bring a given asset class to an acceptable condition and to maintain it at that condition. Reported unmet need does not include sidewalks or unpaved streets. Adjacent property owners are financially responsible for repairing sidewalks; therefore, the City does not have an unmet sidewalk repair need. Figures do not include unpaved streets as the City is not financially responsible for upgrading and maintaining unpaved streets.
C. Environmental Services

Profile

The Bureau of Environmental Services (BES) provides sewer and stormwater collection and treatment services to 580,000 people, numerous commercial and industrial facilities, and six wholesale customers. The existing system consists of 1,012 miles of separated sanitary sewers, 883 miles of combined sewer that carry both stormwater and sanitary waste, 458 miles of stormwater pipes, 1,530 stormwater pollution reduction facilities (90 percent of which are green surface facilities), 97 pump stations, and two wastewater treatment plants. These assets are valued at approximately $12.5 billion.

Asset Management Approach

Asset Management has been part of the business practices at BES for over 20 years beginning with the implementation of the Hansen Maintenance Management Database and condition assessment scoring in 1990. Recently, the bureau updated its performance measures to incorporate levels of service (LOS).

Uses of Asset Management

The Systems Plan for the combined and sanitary collection systems has been integrated into the proposed 2014–2018 Capital Improvement Plan. The System Plan incorporates system inventory, condition, GIS data, and failure records into an asset management context including a risk register (likelihood of failure times consequence of failure). Recommended projects are based on life-cycle cost with consideration given to financial, social, and environmental benefits. The goal is cost effective expenditures that result in optimal asset value and customer service. A similar effort is now underway for the stormwater collection system. The first product of this effort was a pilot study for the Stephens Creek sub-watershed in SW Portland.

The companion Capacity, Management, Operation & Maintenance (CMOM) project is identifying the appropriate sewer maintenance routines and repairs to enable the individual infrastructure components to reach an optimal useful service life at an overall least cost. Two interim reports were submitted to DEQ in December 2012: Collection System — Assessment and Rehabilitation Plan and Collection System — Inspection and Cleaning Plan.

Asset Management Practices

BES currently applies AM practices of asset inventory, condition assessment, and computerized maintenance management systems for its system components: treatment, pump stations, and collection systems. The bureau has completed its three-year infrastructure planning effort which has resulted in an upgraded System Plan for the sanitary and combined collection system. The plan incorporates system inventory, condition, GIS data, and failure records in an AM context to develop a risk register consisting of likelihood of failure times consequence of failure. This work has been incorporated into the annual planning process for the CIP. The plan identifies the appropriate sewer maintenance routines (and repairs) to enable individual infrastructure components to reach an optimal useful service life at an overall least cost. BES has initiated a similar multi-year effort focused on the stormwater system.

Asset Value and Condition

The overall replacement value of BES assets increased to $12.5 billion in 2012. This reflects some new assets coming on line, an updated staff assessment of treatment facilities, and an adjustment for ENR (9080 to 9291).

Unfortunately, better data continues last year’s trend of fewer assets in good or very good condition. Some improvement is expected in the next ten years as capital resources have a primary focus on rehabilitation of aged pipes and pumping systems.

Annual Funding Gap

The current financial plan includes an ambitious pipe rehabilitation program focused on pipes with the highest risk, primarily in the combined system. The financial plan also includes many, but not all, of the recommended capacity related projects from the Systems Plan.

The gap assumes all rehab projects in the proposed financial plan proceed as programmed. Over $200 million is proposed for combined and sanitary sewer rehab.

The extent of stormwater system needs is unknown. The estimate makes very broad assumptions from the Stephens Creek pilot for both rehab and capacity needs.
**Asset Management Improvement Priorities**

This past year, the Bureau performance indicators were aligned with the draft LOS. In the coming year, there will be further refinement of both the performance indicators and the LOS including cascading down to the Group level.

**Calculation Methodologies**

**Replacement Value**

The replacement value of the combined and sanitary sewers was recalculated in the recent combined and sanitary sewer elements of the BES System Plan. The stormwater system was recalculated based on factors in the above-referenced document. The treatments were adjusted based on recent staff assessments.

**Current Condition**

BES uses a variety of methods to measure current condition. Methods include visual TV inspection, age, material, and history of failure of adjacent pipes (to indicate remaining useful life).

Condition for combined sewers and sanitary sewers are based on regular ongoing assessments. Analysis of the data has been updated as part of the System Plan. A similar multi-year review of the stormwater system is underway. Condition for wastewater treatment systems are based on estimate of repairs for each process area. Assets at the Columbia Boulevard Wastewater Treatment Plant are experiencing degradation due to the high capacity of flow relative to the capacity of the facilities. A number of upgrades, currently in construction, will result in significant improvement to this situation.

**Annual Funding Gap**

The funding gap is based upon the following:

- **R/R/R** — The difference between the replacement value of assets in very poor condition and the amount of funding in the financial plan for rehabilitation of those assets.

- **Capacity — Combined** — Projects recommended in the Systems Plan with positive benefit/cost ratios (primarily those that address conveyance of the 2-year storm in combination with deteriorated pipes) that are not included in the financial plan. Note that the gap does not include all projects required to meet stated LOS for conveying the 25-year storm.

- The value of the stormwater system reflects only the piped system and other constructed facilities (such as sumps, green streets, water quality facilities). It does not include natural systems — either the value of them or the funding gap to address watershed health/habitat or anticipated regulatory changes related to the MS4 permit.
D. Water

Profile

The Portland Water Bureau (PWB) delivers potable drinking water for consumption and fire protection. The City is the largest supplier of domestic water in Oregon, serving more than 800,000 people and providing about 100 million gallons of water per day, or about 36 billion gallons per year. About 60 percent of the water is delivered to customers within Portland city limits. The remaining 40 percent is sold to customers in 19 surrounding cites and special water districts. Water is supplied from the Bull Run watershed and the Columbia South Shore wellfield through more than 2,000 miles of pipes. The water system is valued at $7.1 billion.

Asset Management Approach

The Water Bureau has an Asset Management Group (AMG), located within the Engineering Department, which coordinates asset management activities within the organization. An Asset Management Steering Committee makes policy decisions related to asset management and approves major work items.

Uses of Asset Management

The approach to Asset Management in the Bureau has been to focus on key asset management concepts. To achieve progress in Asset Management, the Water Bureau has taken the following actions:

- Incorporated key service levels into the Strategic Plan. Those service levels have been tracked for the last three years. In FY 2011–12, the Bureau met 19 of its 27 service levels.

- Asset Risk Management. There is a risk service level. The bureau identifies key assets, assessing the potential risk of asset failure, and then is committed to either better understanding the risks or taking steps to mitigate those risks. There are currently 6 extreme risk assets and 46 high risk assets.

- Conducting condition assessments of potential high risk assets. Among the on-going condition assessment activities that have been completed are spot excavations of several pipes that cross under major highways, visual inspections of more than 20 pipes on bridges, and leak detection of 23 miles of large diameter pipe.

- Performing dozens of business cases and using the results to support project planning, design, construction and operation decisions.

- Creating Asset Management Plans (AMPs) that define maintenance, repair and replacement strategies for the assets. There are budget program strategies in place from three existing AMPs. The bureau has completed 15 AMPs, with five more in development.

Asset Management Practices

As noted above, the bureau has continued with its tracking of service levels, identification and mitigation of risks, condition assessments, business case development and creation of Asset Management Plans.

Asset Value and Condition

The overall replacement value of the Portland Water Bureau’s assets increased from $6.9 billion in 2011 to $7.1 billion in 2012 due to estimated inflation of the costs for replacement of assets.

There has been little change in the overall condition of the water system since 2007. The vast majority (84 percent) of supply, transmission, and distribution systems are in fair to very good condition. Seventy-four percent of terminal storage is in poor to very poor condition and 48 percent of buildings and support facilities are in poor to very poor condition.

Annual Funding Gap

A funding gap exists in the need to replace assets in poor condition, to maintain the overall condition of other groups of assets, and to meet bureau service level goals with improved technology (enhancement of current technology used by the Water Bureau that is becoming obsolete).

Baseline unmet needs amount to $165 million over 10 years. This includes $55 million in one-time investments and $110 million in investments that can be allocated over the 10 years, or approximately $11 million a year on annual recurring costs. The following list reflects the Water Bureau’s anticipated system needs beyond the current level of funding.
Distribution:

- Replacement of hydrants: Replacement of all hydrants in poor condition not being met by current funding levels
- Replacement of services: Replacing all plastic and galvanized services not expected to be replaced under the current funding levels
- Replacement of valves: Replacement of all large valves in poor condition
- Facility valves: Install drainage valves at 58 active tanks and 38 pump stations
- Replacement of high risk pipe segments in poor condition: Replacement of all poor condition pipe segment crossings of bridges, major arterials, freeways and railroad lines and funding a pipe condition assessment program
- Replacement of pump mains: Replacing the sections of two major pump mains that are currently in poor condition but not funded for replacement
- Installation of an Advanced Metering Infrastructure system to facilitate monthly billing, demand management and pressure and leakage management
- Pipe relocations and replacements in response to bike boulevards, green improvements, or inadequate cover on road reconstruction. This gap would increase if PBOT gets funding for the Streetcar Master Plan.
- Expanded predictive/preventive maintenance program for site valves and pipes, tanks and fountains
- Tank cathodic protection and seismic upgrading

Asset Management Improvement Priorities

The Water Bureau continues to expand its efforts to implement Asset Management. An Asset Management work plan for the organization was created in 2010. A stakeholder group reached consensus on the focus of the next steps of the organization in Asset Management. The decision was made to create work groups to complete Asset Management Plans (AMPs) for all major asset groups (15 separate AMPs), to conduct facility valve condition assessments over a five-year period, and to continue with the current efforts on service levels, risk and business cases. An updated work plan will be completed in 2015.

Calculation Methodologies

Replacement Value

In most cases, the replacement value is based on the current costs to install assets and includes all overhead costs (assumed at 1.135 times total personnel costs). Replacement costs were last estimated in 2011 and are inflated by 4.3 percent to reflect current replacement values. As the Water Bureau finalizes their asset management plans (AMP), the costs will be updated in future City reports.

Current Condition

Condition can be based on age, visual inspection, deterioration or failure curves. The Water Bureau matches one of these methods to each asset type.

The Water Bureau uses available information to assess physical condition of its assets. The least specific is a rating based on asset age relative to useful life. The most specific form of rating is based on an actual field condition assessment of individual assets. Intermediate forms of estimating condition involve ratings based on the judgment of Bureau personnel most knowledgeable about a particular asset or group of assets or partial inspection data, extrapolated to an entire asset class. For pipes, the Water Bureau uses Weibull curves of the failure rate by age of the asset class. Deterioration curves are used for pump, tank, and several other assets.

All reported condition information values are based on the percentage of value of assets. All notable asset groups are included.
Annual Funding Gap

The Water Bureau calculated its annual funding gap in two ways. For some assets, poor physical condition triggers the gap. For other water assets, the gap is measured by the need to mitigate the high risk of asset failure (relocate pipes due to other infrastructure projects), or the desire to make a sound investment decisions (install advanced metering infrastructure system).

The reported funding gap includes costs to:

- replace screw-type hydrants, pump main segments, high risk pipe segments, and large valves in poor condition;
- replace meters at a sustainable rate;
- replace/upgrade sections of the oldest conduits; and
- improve maintenance of valves, tanks, fountains, and the Bull Run watershed road system.
E. Parks

Profile

Bureau Highlights

Portland Parks and Recreation (PP&R) has continued to refine and implement its asset management practices.

- **Technology** — PP&R upgraded the MS2000 work order system to the current version of MicroMain. This transition will help PP&R more accurately track and maintain assets over their useful lives. PP&R is also refining terminology and definitions to ensure more accurate and consistent reporting.

- **Assessments** — PP&R continues to conduct inspections and assessments of the asset system, with regular inspections of all buildings, pools, and play equipment. The bureau continues to add new assets to its inspection and condition assessment program.

- **Strategic Plan** — The bureau’s 2012–15 Strategic Plan includes Asset Management as one of six key strategic themes. Five initiatives are aimed at adapting best practices to the widely diverse portfolio of public parks, recreation and natural area assets.

- **Bureau Structure** — Two existing positions, previously partially involved in asset management, have been wholly dedicated to the Asset Management program. The program manager reports directly to the Senior Manager for Planning, Development and Asset Management.

Asset Management Approach

- All PP&R assets, both built and natural, that are owned and managed by PP&R are accounted for in six asset class groups: Amenities, Buildings/Pools, Recreation Features, Utilities, Circulation, and Green Infrastructure. All major assets are identified in PP&R’s Geographic Information System (GIS). Work continues to add all assets to the GIS and CADD systems, as well as keep up with changes on the ground.

- Asset Management practices and principles are used to coordinate asset data, develop accurate asset inventories and produce up-to-date reports. Accurate AM data coupled with statistically valid information on customer needs and desires allows PP&R to make informed decisions about the assets needed to provide specific services.

- PP&R’s AM program continues to help implement Parks 2020 Vision by ensuring the provision of high-quality facilities, providing for long-range capital needs and developing best management practices. It allows Parks to fulfill a major part of its mission of developing and maintaining excellent facilities and places for public recreation.

- Initial work focused on the more heavily used facilities and on the basic elements that provide good visitor experiences. Current efforts expand inventory and condition assessments to parks and natural areas circulation systems and infrastructure.

Uses of Asset Management

AM information is utilized in preparing PP&R’s capital plans and budgets, developing consistent maintenance and operations regimes, fulfilling City and federal reporting requirements, informing system planning, and supporting financial forecasting. Applying asset management principles and practices helps prioritize capital projects and allocate scarce resources.

As asset management continues to be integrated into PP&R management practices, PP&R is better able to determine acquisition and capital improvement needs, provide appropriate levels of maintenance, and determine which assets to acquire and which to dispose of in order to develop a stable asset portfolio that meets service needs.

Asset Management Practices

- Current efforts focus on improving the inventory, attribution and condition of circulation systems and utilities infrastructure. Buildings and playgrounds have been inventoried and are assessed regularly. A new green infrastructure, natural area condition methodology has been developed, and PP&R intends to continue updating the condition using the new methodology. Marine facilities, docks and ramps have been assessed and are included in a longer-term rotation. PP&R has developed an inspection and condition assessment work plan, currently extending through 2015, intended to bring new assets into the condition assessment rotation.

- For many assets, PP&R has completed the initial inventory and condition assessments and is in the process of inspecting 20 percent of all assets each year. By 2015, all remaining assets will be included in this annual rotating schedule, with most assets being inspected at least once every five years and more often in high risk cases.
PP&R is pursuing a lean approach to developing and implementing asset management. A small staff team is developing and implementing best practices system-wide, working in collaboration with parks, recreation facilities, and natural areas maintenance staff.

Coordination between Asset Management, Planning, and Services departments. The focus is on business process improvements that increase knowledge of asset conditions while increasing efficiency. Leverage tools include GIS, CADD and CMMS.

**Asset Value and Condition**

The overall replacement value of PP&R’s assets increased from $931 million in 2011 to $984 million in 2012 due to inflation and the addition of new assets.

Overall condition saw a small downtick in 2012 compared to 2011. This is primarily due to the completion of a comprehensive playground inventory and assessment project that improved the quality of condition data. Marine assets, docks and ramps, were also thoroughly inspected and condition scoring improved significantly. However, there are so few of these assets that the overall score was not affected much.

**Annual Funding Gap**

PP&R has an expected total capital annual funding need of $83.9 million for each of the next 10 years. This includes $48.7 million for expanding the system to provide standard levels of service for all residents, in addition to $35.2 million in funding needed to maintain existing assets. The funding need calculations are based on the 1- to 5-year, 10-year, and 20-year total list of all identified potential PP&R projects. This is an increase from last year, primarily due to the addition of new projects to the capital list and a reduction in anticipated revenues due to the economic climate.

PP&R receives an average of $5 million annually in System Development Charge funds, plus grants and donations. Additionally, City Council has been able to provide about $1 million annually to address some of the most urgent needs for repair, rehab and replacement and mandated work. This totals an average of $6 million annually available for capital, leaving a funding gap of $83.9 million annually to expand and maintain current assets.

Maintaining existing assets in good condition depends on regular repair and replacement, which depends on sufficient regular funding, which has not kept up with need. The recommended standard for reinvestment needed to maintain building assets in good condition is from 2 percent to 4 percent of the asset’s current replacement value (CRV). With an average of below 2 percent of CRV in funds to reinvest in past years, PP&R has consistent shortfalls and a widening gap. In 2012, PP&R invested 1.5 percent of CRV (based on calculation of major building and pool reinvestment only).

**Asset Management Improvement Priorities**

The 2012–15 Strategic Plan includes asset management as one of six strategic themes. Five initiatives outline the bureau’s priorities over the next three years, as follows below:

- Establish levels of service by asset classes.
- Assess condition of assets to determine remaining useful life.
- Develop asset risk profiles.
- Prepare asset management plans.
- Develop funding strategies for capital improvements.

**Calculation Methodologies**

**Replacement Value**

PP&R calculates the replacement value for its assets by estimating the installed cost to replace the asset in kind, without increasing its size or changing its functionality, but bringing it up to current code. As PP&R expands and improves its asset management program, more specific valuations are being gathered for all assets. Where specific information is not available, general estimates of the value of all assets are provided, albeit with varying levels of confidence.

<table>
<thead>
<tr>
<th>Method of Asset Replacement Value Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Asset Group</strong></td>

</tbody>
</table>

PP&R is updating its annual asset inspection program to determine the condition of all assets and aims to inspect 20 percent of all critical assets each year. All assets will be inspected at least once every five years and more often in the cases of pools and play equipment or other items that require more oversight and maintenance. PP&R is working to add asset classes to the Asset Management Program each year.

Annual Funding Gap

PP&R has identified capital needs for the next 20 years on its Capital Improvement Project (CIP) list. The PP&R funding gap represents the difference between the anticipated annual revenue PP&R receives for CIP projects and the cost it would take to complete all the projects within the first 10 years of the 20 year CIP list, annualized over ten years.

PP&R tracks four categories of projects on its CIP list. Preserve (repair, rehabilitate, and replace) and Efficiency (projects that improve the cost effectiveness of maintaining and operating our assets) are combined into the R/R/R category for the citywide report. Safety (projects needed to bring existing assets up to current codes and meet mandates such as ADA) is reported as Mandate. Growth (projects that expand the system and are needed to meet current service levels for all customers) is reported as Capacity. Examples of Capacity projects include developing new parks, new community centers, and new trails, or building new features in parks, like new spray play features or skate parks in neighborhoods where current levels of service are below PP&R standards.
F. Civic

Profile

Asset Management Approach

The Civic AM program includes two asset groups: Facilities and Technology. The Facilities group includes facilities managed by the Office of Management and Finance (Police facilities, office buildings, other buildings, Union Station, and spectator facilities) and facilities other organizations manage (Fire facilities and Portland Center for the Performing Arts). The Technology group includes the technology assets that OMF owns and manages through its Bureau of Technology Services and the Enterprise Business System owned and managed by Enterprise Business Solution.

OMF takes the lead for the Civic Assets group. In FY 2009 management of the City’s parking garage assets was transferred to PBOT.

Asset Management serves as the basis for documenting the physical and financial status of these assets, coordinating asset data, developing accurate asset inventories and producing up-to-date reports and maintenance plans. Accurate AM data allows OMF and other organizations to make informed decisions about assets. The annual and one-time funding gaps are the main indicators of financial status of these assets.

Uses of Asset Management

OMF uses AM information to prepare its capital planning and budgets; develop consistent maintenance, operations, and replacement programs; fulfill City and other reporting requirements, and support financial forecasting. Applying asset management principles and practices helps to prioritize projects and allocate scarce resources.

Annual Update

A key component of the OMF Asset Management program for Technology Services is the preparation of five-year maintenance and replacement plans. These plans are produced by BTS staff responsible for AM and are reviewed and refined by a management review group. Priority is given to items that support public safety, improve reliability and availability of critical data systems and improve efficiency and reduce costs through the consolidation of infrastructure.

Over the last several years the City has invested in the replacement of large Civic assets. These investments include the replacement of the IBIS financial system with the SAP enterprise business solution, the replacement of the Police property warehouse, and the replacement of the Auditor’s archives center. Additionally, a combination of General Fund resources approved by the Council and General Obligation (GO) bonds approved by voters in November 2010 fully funds the Public Safety Systems Revitalization Project that replaced Computer Aided Dispatch in April 2011 and will replace the Portland Police Data System and the 800 MHz radio system.

However, other Civic Assets continue to have large annual and one-time funding gaps for major maintenance.

Fire Facilities — Voters approved a GO bond measure in November of 1998 to rehabilitate, relocate, and construct new City fire stations. The program addresses deferred maintenance in addition to addressing seismic requirements and program changes within the Fire Bureau. The program is almost complete and will run through FY 2013–14.

Fire has no ongoing budget authority for major maintenance projects for these new facilities. Fire does have regular operations and maintenance budgets for these facilities. Over the 10-year period of FY 2012–13 to FY 2022–23, overall condition will not decrease. However, without identifying major maintenance funding up for the future when the large needs come due in 20–30 years, no money will be available. The City will find itself in the same position as in 1998 when there was too much deferred maintenance to fund and the buildings had not been modified for the changing needs of the bureau. Funding for major maintenance of Fire facilities should be set aside each budget year, as is done for Police facilities and office buildings.
A GO bond measure approved by voters in November 2010 provides for funding of the replacement of a fire station in inner southeast on the Willamette River.

OMF has high confidence in this assessment. It is based on very recent completed projects to rehabilitate and construct new, or projects in progress for which we have gained considerable experience.

**Facilities Services** — Through its rental rates Facilities Services collects major maintenance money for office buildings (Portland Building, City Hall, and 1900 Building), Police facilities, maintenance facilities, the Portland Communications Center, and the Archives and Records Center. Major maintenance money is also carved out from net income of Union Station to fund major maintenance projects at that facility.

While the industry standard, and OMF's goal, for facility maintenance is to reinvest three percent of a building's current replacement value each year, OMF is currently only able to reinvest about 1.6 percent. This level of reinvestment has declined in recent years. Reasons for the decrease are rapidly escalating costs to replace buildings (over regular inflation), the increase in the number of new facilities, and only increasing the major maintenance component of rental rates at the level of regular inflation.

This 1.6 percent reinvestment level allows OMF to cover immediate needs on the five-year horizon. This is also enough so that over the 10-year period of FY 2012–13 to FY 2022–23 overall conditions are not expected to decline from the very broad categories of good, fair, and poor. Contributing to this is the relative low age of these facilities and the recent renovation of some facilities. However, when large major maintenance needs come due in 20 to 30 years, asset conditions will decline.

Since the likelihood of rental rate increases is low, funding for major maintenance should be increased by directing savings from efficiencies identified to major maintenance until the 3 percent goal is achieved.

For all facilities, except spectator facilities and Union Station, the funding gap is the annual difference between what is collected in rental rates, or set aside from net income, for major maintenance and the industry standard of 3 percent of replacement value. For spectator facilities, the gap is the one-time difference between actual fund reserves for capital maintenance and a target level of $35 million based on the costs to upgrade Memorial Coliseum. Union Station's one-time funding gap is $45 million based on unfunded deferred maintenance.

Recently, Union Station has received grants to assist in maintaining the asset. These monies have been used mainly for the roof, which is the most pressing need. Grants are this facility's best resource for addressing maintenance needs.

OMF Facilities has recently received a consultant's report on the condition of the Portland Building's exterior envelope and its ability to withstand a seismic event. Staff are analyzing the information and developing recommendations for Council to address these issues.

OMF has confidence in this assessment. It is based on a complete inventory of buildings. The conditions are assessed based on visual inspection by qualified personnel on a regular schedule.

**Portland Center for the Performing Arts** — This complex includes the Keller Auditorium, Arlene Schnitzer Concert Hall, and the Antoinette Hatfield Hall. The City owns these assets and through an intergovernmental agreement Metro/MERC manages, operates and maintains them. The replacement values of these three assets are included, but the City has limited information on their status. OMF is in the process of working with Metro/MERC to provide more City oversight to these assets.

**Technology Services** — Establishing replacement values, current conditions, projected conditions, and funding gaps for technology infrastructure requires a different approach than for facilities infrastructure. Unlike buildings, technology infrastructure can quickly become unusable. This is primarily due to the short lives/quick obsolescence and the critical need to stay current with technologies that may not be supported by vendors in the future and render the technology unusable. Below is a discussion of the unique nature of BTS infrastructure replacement values, conditions and funding gaps.

OMF has high confidence in these assessments, except in the FY 2022–23 assessment where confidence is moderate.

OMF has established a multi-bureau committee to address the replacement of major Public Safety technology systems including the 800 MHz radio system, BOEC CAD, and Portland Police Data System. This work, called the Public Safety Systems Revitalization Program (PSSRP), will address funding, governance, coordination, timing, and other issues related to the replacement of these major systems. The replacement values of these systems vary depending on the approach planned and so should only be considered orders of magnitude.
As part of prior budget processes the Council authorized a mix of debt and cash financing for the PSSRP. This and GO bonds approved by voters in November 2010 fully fund the program.

**800 MHz Radio System — Core System** — The 800 MHz system will be replaced prior to FY 2022–23 because its condition deteriorates to less than poor by then. The system has to be replaced prior to FY 2022–23 because prior to then Motorola, the system’s vendor, will not provide support to it, as technology is becoming obsolete. The underlying component chips are old, it is an analog system, and Motorola is focusing on digital systems.

**800 MHz Radio System — Devices** — Just as the core system has to be replaced prior to FY 2022–23 because the condition falls below poor, the system’s devices which use the system have to be replaced.

**CAD and PPDS** — A replacement for the CAD system was completed in April 2011. The PPDS system will be replaced prior to FY 2022–23. The replacement of this system is progress.

**Communications — Integrated Regional Networking Enterprise (IRNE)** — The annual major maintenance funding gap for this system is 10 percent of replacement value less $318,000 currently included in the rates for major maintenance. Ten percent of replacement reflects the ten-year life of the infrastructure. The original IRNE financial plan assumed that efficiencies as achieved would be retained in the rate base to provide replacement and major maintenance funding; however, the budget reduction requirements over the last few years have required those efficiencies being converted into rate relief as opposed to replacement/major maintenance funding. The replacement value listed does not include the fiber provided to the City as part of franchise agreements and partnerships.

**Production Services** — The assets in Production Services (formerly, IT Operations) include storage area networks (SAN), data networks, email system, and core servers. This infrastructure has a life of five to eight years. OMF’s assumption about condition in FY 2022–23 then is based on the infrastructure needing to be replaced twice in the 10-year period. BTS should be collecting one-eighth to one-fifth the replacement value of the hardware per year. However, the fund is collecting below this level and having to supplement these collections with money from its reserves to avoid conditions moving to a poor rating. The fund has been able to redirect some savings from efficiencies and rates into this replacement fund.

**Strategic Technologies — Corporate Applications** — Corporate applications include GIS, TRACS, CAD, PPDS, and CIS. CAD and PPDS were discussed above as part of the PSSRP. CIS is relatively new and GIS has money in its rates for on-going improvements. TRACS is in the process of being replaced.

**EBS Services** — This asset grouping includes the City’s enterprise business system implemented to replace IBIS and numerous other information systems. It is operated and managed by a new division within OMF. Plans call for the asset to be continually improved and expanded in functionality.

**Asset Management Improvement Priorities**

OMF has identified the following asset management improvement priorities:

- Improving data (particularly condition and tracking of maintenance activities).
- Improving data integration.
- Completing system-wide asset management plans.
- Evaluating service delivery.
- Improving coordination of AM activities.
- Improving staff AM knowledge.
Calculation Methodologies

Methods for civic assets fit into two categories: Facilities and Technology.

Facilities

Replacement Value

Replacement values are based on the size of facilities, the type of facility, and costs per square foot to construct that type of facility. To this are added percentage mark ups for indirect costs, including overheads.

Condition

Condition assessment is based on an inventory of buildings. Conditions are assessed based on visual inspection by qualified personnel on a regular schedule and are expressed as a percentage of assets in each rating category. Condition ratings for the Portland Center for the Performing Arts have not been determined at this time.

Annual Funding Gap

For all facilities, except spectator facilities and Union Station, the funding gap is the annual difference between what is collected in rental rates, or set aside from net income, for major maintenance and the industry standard of 3 percent of replacement value. Current funding at 1.6 percent of replacement value ensures relative condition (percentage in good, fair, and poor condition) remains relatively constant over the next ten years.

For spectator facilities the gap is the one-time difference between actual fund reserves for capital maintenance and a target level of $35 million based on the costs to upgrade Memorial Coliseum. Union Station’s one-time funding gap is $45 million based on unfunded deferred maintenance, in addition to the annual gap. The annual gap assumes the $45 million one-time gap is funded to catch up on deferred maintenance and bring the building up to current standards. Unmet need for the Portland Center for the Performing Arts is not included in the total.

Technology

Establishing replacement values, current conditions, projected conditions, and funding gaps for technology infrastructure requires a different approach than for facilities infrastructure. Unlike buildings, technology infrastructure can quickly become unusable. This is primarily due to the short lives/quick obsolescence and the critical need to stay current with technologies that may not be supported by vendors in the future and render the technology unusable.

Replacement Value

The replacement value assessment is based on recently completed projects and the experience of other governments, but we have not had an opportunity to analyze their experiences to assess the degree of similarity. These values include indirect costs for engineering and other professional services, but do not include indirect costs for City overheads.

Condition

Condition ratings for Technology assets are based on current age and expected useful life. Condition is expressed as a percentage of assets. Systems considered to be obsolete are included in the poor condition rating.

Annual Funding Gap

The funding gap includes annual funding necessary to meet industry standards for major maintenance (Communications); and annual needs to ensure replacement and upgrades of technology on accepted schedules (Production Services).
5. Asset Management Practices and Process

Asset management is an industry standard that provides a risk mitigation approach to decision making. It is commonly defined as meeting agreed upon customer and environmental service levels, while minimizing life cycle costs at an acceptable level of risk.

At present, bureaus apply elements of AM best practices customized to meet each bureau’s unique needs. The CAM group continues to prepare the annual Citywide Asset Report, and works to identify key measures, define terms, and collect and display each year’s data.

A. History and Progress

For over 20 years, individual City bureaus have initiated components of Asset Management. Five of Portland’s infrastructure bureaus — Transportation (PBOT), Water (PWB), Environmental Services (BES), Parks and Recreation (PP&R), and Management and Finance (OMF) — apply AM principles to some of their practices. Separately, the Office of Housing Policy and Portland Development Commission (PDC) track affordable housing units. Unlike the five infrastructure bureaus, the City does not own most affordable housing units in the city.

Ten years ago, the AM focus began to broaden to a citywide focus. At that point, infrastructure bureaus began to prepare an annual citywide report on assets. These reports are presented annually to the Planning and Development Directors’ group, which represents infrastructure, development permitting, financial and planning bureaus. The Directors’ group oversees policies and resource allocation, coordinates long-range planning, and manages certain cross-bureau planning and development initiatives. After reviewing findings of the annual report, the Directors’ group provides recommendations to City Council. Each AM report is presented to the City Council at the start of annual budget work sessions.

Although the City’s infrastructure bureaus started with, and continue to use, different AM strategies, bureaus collaborate actively with the long-term goal of improving AM practices citywide. As such, bureaus use common definitions and terminology but apply techniques consistent with their bureau’s structure and the unique needs of their assets.

The following timeline identifies major milestones in the development of citywide asset management within the city.

2002
The Auditor, City Commissioners and bureau directors completed a strategic exercise, Managing for Results. They identified seven priority issues and flagged five of them for “immediate action.” One of the priority issues was aging physical infrastructure.

2003–2004
Asset managers from the City’s infrastructure bureaus formed a City Capital Maintenance Committee to collaborate on AM issues and prepare an annual report on the City’s physical assets. Their reports to City Council in 2003 and 2004 focused on the current and projected condition of infrastructure, not on the strategies needed to manage assets over their whole life. Efforts to describe assets and needs varied from bureau to bureau as did confidence in the information. This made it difficult for City Council to make decisions using that information.

A special feature of the 2003 report was to identify potential funding sources to bridge Portland’s maintenance funding gap. It used a matrix format, based on a January 2001 analysis of potential transportation revenue options (prepared by PBOT).

2005
The committee became the City Asset Managers Group (CAM group), adopting a more holistic approach to AM and looking for ways to collaborate on common AM issues. While Transportation had an existing program of AM, other bureaus were just beginning to adopt AM principles and techniques. By joining forces, the CAM group identified common long-term AM needs and helped frame AM throughout the City using a consistent approach.

In the FY 2005–06 budget process, City Commissioners asked for better data on the funding gap in capital maintenance. There were questions about the quality and completeness of the data, and doubts about bureaus’ stated funding needs. To address Council’s
concerns and to reflect the current state of City asset management, the 2005 report added three features: common definitions for basic asset management terms, data confidence levels, and bureau observations on their asset management activities.

**2006**

The 2006 report added affordable housing as an asset category. For purposes of this report, affordable housing was defined as multi-family rental housing units with direct City investment (leveraged financing) and a regulatory agreement with the Portland Development Commission.

**2007**

The 2007 report included a pilot of risk analysis and a framework for the inclusion of green infrastructure. BES reported on some green infrastructure.

**2008**

To assess current capacity and interest in improving AM best practices, Transportation, Water, Environmental Services, and Parks completed a survey, prepared by the Bureau of Planning. Generally, the survey found that the participating infrastructure bureaus have initiated elements of AM best practices, with each bureau taking a different approach. The survey identified five priority AM best practices areas for further exploration: data collection and management, service levels, asset management plans, risk management, and business case. The 2008 report introduced these AM best practices and reported on bureaus' current and potential capacities to adopt them.

**2009**

In 2008, the CAM group retained an outside consultant to assess the use of asset management best practices to optimize City investments in infrastructure. The assessment included research on high-performing peer communities in North America and established recommendations for a sequence of AM best practices. These recommended best practices were used as a basis for development of a citywide asset management work plan for 2010–2014, included in the 2009 report.

**2011**

In 2011, the CAM group featured service level examples, from four City bureaus:

- **Transportation** showed service levels for thirteen transportation asset classes (from PBOT's Infrastructure Asset Report Card — 2010). The focus was on the maintenance of existing transportation infrastructure. Its purpose was to develop and implement levels of service for each asset class to track and monitor performance and outcomes achieved.

- **Environmental Services** showed service levels in seven action areas. It tied customer and technical service levels, based on customer core values and strategic outcomes.

- **Water** showed the status of eleven service level indicators, from Portland Water Bureau Strategic Plan 2008–2011. The Water Bureau has created key service levels (27) and programmatic service levels (40+).

- **Parks** showed how performance measures track progress toward outcomes in its three year Strategic Plan. Each performance measure is linked to a target.

**2012**

This 2012 report separates out policy recommendations, distinguishes between data and business practices, and displays annual funding gap in more ways.
B. Citywide Asset Management Work Plan

In 2009, the City Asset Managers Group developed a Citywide Asset Management Work Plan to guide asset management improvements between 2010 and 2014. The work plan was informed by the internal survey (completed in 2008–2009) and a review of peer communities (completed in 2009). This work laid a foundation for identifying the steps necessary to move the City towards more comprehensive asset management practices.

Four City bureaus participate in the work plan: Environmental Services, Water, Transportation and Parks and Recreation. This year, the CAM group realized that some tasks will take longer than the initial five years, and affirmed the importance of making continuous improvements. For the 2012 report, the CAM group will outline milestones for the tasks through the year 2019 (a second five-year interval).

This work plan lays out general approaches and timelines for cross-bureau work to apply seven advanced asset management best practices:

- Service levels
- Risk management
- Report cards
- Business case
- Reliability-centered maintenance
- Long-term investment profiles
- Community information and consultation

The CAM group anticipates that the work of individual bureaus will progress on varying timelines based on the status of current practices, resources, and relative priorities. As many of these best practices are interdependent, the CAM group recognizes that achieving the goals outlined in the work plan will require continuous and iterative improvements.

Each bureau director is tasked to implement the bureau’s core mission, goals and values, along with the City Charter, state and federal mandates, and community priorities. AM offers a framework and tools to examine and address infrastructure needs to help meet this charge. As asset management improves across the bureaus, so will the ability of City Council, bureau managers, and citizens to make informed decisions about asset-related services.

However, advances in AM practices are not accomplished overnight. Each bureau encounters a unique set of challenges and barriers to implementing AM best practices. Bureaus are constrained by budget and resources, limitations in data and data management systems, and other commitments and priorities.

To meet these challenges, the work plan relies on the CAM group to continue to share information and mentor each other to build AM capacity and expertise citywide. The work plan assumes a phased implementation of AM improvements, with flexibility to meet the needs and capacities of each bureau. The CAM group will report to the Planning and Development Directors.

The CAM group plans to apply these best practices to all assets in the future. However, due to limited resources and breadth of this work plan, many tasks focus initially on highest risk assets. The CAM group will report on progress in each of these tasks annually through the Citywide Assets Report and through updates to the Planning and Development Directors.

A summary chart follows a profile of each work plan task. Service levels (task #1) and risk mitigation (task #2) interact directly with funding levels.
Task #1: Service Levels

**Definition**
Service levels establish measurable standards against which actual achievement can be compared. Service levels set expectations for what service to provide, in what quantities, and how often. Service levels are most useful in a long term perspective (sustainable). There are internal and external service level targets. Service levels may address reliability, quality, quantity, and safety. AM planning allows bureaus to set service levels and cost of service. Both can be evaluated with customers and regulators to set the optimum service level they are prepared to support.

**Goal**
To develop meaningful and measurable service levels based on system needs that match the expectations of customers to guide funding and investment decisions.

**Desired Outcomes**
The four participating CAM group bureaus will have established tangible service levels or performance measures, with targets consistent with industry peers. Each bureau will use service levels to bridge its organizational strategies to its tactical assets. Progress in service level work is reported in the annual city asset reports.

**Approach**
For CAM group bureaus without refined service levels, research and information-sharing will help identify what service level changes they need. Bureau service levels will be developed or refined, in combination with appropriate community consultation. Any established service levels will be adopted as a component of the Citywide Systems Plan. Further refinement of service levels will occur over time, as needed.

**Interrelationships**
Defining service levels for assets sets a foundation for all of the remaining work plan tasks.

**2012 Status**
Currently, bureaus have capacity to measure and track a limited number of actual levels of service.

**Environmental Services**
BES has developed a draft Level of Service document, and will test and adjust service levels as needed. Benchmarks and performance measures are in progress. BES has 44 service levels (a mix of system and maintenance). There is no formal process to adopt the service levels.

**Water**
The PWB has created two tiers of service levels: 27 key service levels and more than 40 programmatic service levels. The bureau also has workload measures in each budget program that supports specific service levels. In FY 2011–12, the bureau met 19 of its 27 service levels.

**Transportation**
PBOT has developed service levels for infrastructure maintenance.

**Parks and Recreation**
Parks 2020 Vision establishes broad levels of service for parks, trails, and recreation programs. Established performance measures report on progress toward Strategic Plan outcomes and service level targets. These provide additional management level of service targets. Linkages between broad levels of service to operational levels of service are in process.
Task #2: Risk Management

**Definition**  
Risk management provides a structure to assess and act on risk of assets failing to provide needed service. It navigates degrees of uncertainty by identifying possible events, understanding their likely consequences and determining an appropriate response. Effective risk management relates asset failure to decisions to acquire, maintain and renew assets.

**Goal**  
To identify assets most critical to achieving sustained performance of agreed service levels. In more advanced stages, bureaus will use risk data to prioritize resources and collaborate with other bureaus to identify collateral risks to other public assets.

**Desired Outcomes**  
The four participating CAM group bureaus have identified high-risk assets and have begun to prioritize monitoring and data collection within available resources.

**Approach**  
The CAM group has discussed risk management methodologies. The CAM group will look for opportunities to collaborate, such for interdependent assets. As appropriate, bureaus will identify high risk assets, improve data collection for these assets and apply mitigation strategies based on asset risk classification.

**Interrelationships**  
Data collected will inform Task #3: Report Card, Task #5: Reliability Centered Maintenance, and Task #6: Long Term Investment Profiles. Data will also inform the Citywide Systems Plan (part of the Comprehensive Plan Update).

**2012 Status**  
Bureaus collect a variety of data on their assets, though the extent of and confidence in this data varies by bureau. Bureaus are making progress in identifying high risk assets, at least on some of their asset groups. Bureaus continue to encounter limited capacity to predict likely failure modes for assets and have not estimated the likelihood and consequences of asset failure.

**Environmental Services**  
The combined and sanitary sewer elements of the BES Systems Plan estimates the likelihood and consequence of failure and identifies projects with positive benefit/cost ratios for near term investment. The stormwater system plan is in progress. Building on watershed work, BES is in the process of identifying high risk assets of the stormwater system.

**Water**  
One of the Water Bureau’s service levels is for risk. PWB has identified high risk assets through a process, Consequence Likelihood Evaluation Matrix. CLEM identifies assets/failure modes that may pose substantial risk to the bureau and a process to evaluate the risk and guidelines for action. In 2012, PWB created 15 asset management plans for the majority of asset groups which include a risk analysis of all assets. Those high risk assets at the asset class level will be evaluated through the CLEM process as well.

**Transportation**  
PBOT has begun to identify high risk assets within asset groups. PBOT continues to expand the risk assessment to asset groups. This is a priority for PBOT’s short term internal work plan. The risk assessment will allow for improved prioritization of resources and management of risks. Criteria for consequence and likelihood have been created. A workgroup is in the process of assessing risk of failure of assets using the established criteria.

**Parks and Recreation**  
PP&R is completing a comprehensive review of risks to service delivery of all assets. The Asset Risk Profiles report will provide a list of assets at high risk of failure to deliver levels of service. High risk assets are regularly inspected. Each year, the bureau will add new assets to the inspection program.
Task #3: Report Card

**Definition**  Report cards are a clear and uniform metric (e.g., a letter grade) to indicate the health of the City's infrastructure and bureau's business practices. The metric could combine various measures, including the condition of assets; the degree to which customer requirements (i.e., service levels) are being met; the quality of the information and practices in place for maintaining the assets over their lifecycle; and the degree to which funding is available for lifecycle management of the assets.

**Goal**  To develop a "report card" product that displays the current and projected status of assets, identify trends and issues, and track the City's path to sustainability.

**Desired Outcomes**  A citywide infrastructure report card will appear in the annual Citywide Assets Report. The report card will serve to educate the public, inform City decisions (operations, budget, etc.) and track progress over time. For content, the report card could address asset condition, achievement of levels of service, AM business practices, and/or levels of unmet need.

**Approach**  The four participating CAM Group bureaus will develop a template, recognizing the diversity of bureau approaches to AM and most relevant data for that year. The report card will be highly graphic, and may take the form of a dashboard of selected data. The CAM group will test and refine several formats. The template could include status of assets, levels of service, business practices, and unmet need. Bureaus can provide additional information for their own reporting needs. Once complete, the report card should be included in the annual Citywide Assets Report. Over time, the group will make continuous improvements to the report card and the quality of data presented.

**Interrelationships**  Reporting on service levels would require the completion of Task 1: Service Levels. It is anticipated that the report card will become a component of the Citywide Assets Report. The report card could also be used as a component of Task 7: Community Consultation.

**2012 Status**  All CAM group bureaus currently provide information on assets and AM practices in the annual Citywide Assets Report. In addition, the Water Bureau and PP&R have developed some form of an infrastructure report card.

**Environmental Services**  As discussed in Task #1, above, BES has drafted a Level of Service and organization performance report, and will test and modify the service levels over time. BES suggests a concise report card that spotlights hot button topics, with selected data.

**Water**  PWB issued two "report cards" — a Service Level Progress Report and a budget report.

**Transportation**  PBOT has created a transportation maintenance report card. Using 2010 data as the base year the report card starts an annual tracking process for the condition of 12 transportation asset classes. Each asset class compares actual and target conditions levels. For many years, PBOT has also produced an annual Status and Condition Report.

**Parks and Recreation**  PP&R needs to complete service levels (Task #1) before it can fully participate in an infrastructure report card. PP&R suggests that the CAM group use the report card to track selected measures over time, and consider a dashboard format displaying a composite of measures in order inform decision-making. PP&R's 2011 Performance Report displays historical outcome measures (condition, perception and intervention) for four key result areas. Some measures also project targets into the future.
Task #4: Business Case Template

**Definition** A business case is an economic analysis tool used to evaluate investment decisions in a systematic and logical manner. At the project level, a business case compares project alternatives — such as “do-nothing” or status quo — and uses the costs and benefits to help the bureau make decisions on the best use of financial resources. Business cases are also used at the program level to determine the best level/type of maintenance and operational strategies.

**Goal** To develop a framework or template to justify infrastructure improvements based on lifecycle costs, benefits, and impacts to the triple bottom line (economic, social and environmental factors).

**Desired Outcomes** The four participating CAM group bureaus will have developed a methodology and template for business case and piloted application of the template within their bureau, as appropriate.

**Approach** The CAM group will share information and research to build a foundational understanding of business case among bureaus. Bureaus will evaluate the applicability for their assets and practices and develop templates and application processes, as needed. Application of business case templates will be completed as appropriate for each bureau.

**Interrelationships** Application of business cases could impact project priorities in the annual budget process.

**2012 Status** Most bureaus evaluate multiple alternatives for significant asset investment decisions. Most bureaus consider life cycle costs to maintain and operate, and triple bottom line impacts (economic, social, and environmental).

**Environmental Services** BES has applied business case analysis to the collection system (sanitary and combined). All BES CIP projects must have a business case analysis. Formats vary by project. BES expects to create a business case template and application process within two years. BES has modified its project request form for capital projects (CIP) to better reflect business case criteria. The CIP project evaluation criteria have also been modified. One of the next steps will be to use the revised criteria to re-evaluate CIP projects in the 10-year plan.

**Water** The PWB used available tools from the water utility industry to create a business case approach. The purpose of the business case is to evaluate issues, including options that involve capital assets. Some business cases are about processes like the ones on maintenance or for purchasing new equipment or services. Many are about assets, their risks and affected service levels, and the options that include specific assets. The PWB has created a Business Case Development Guidebook. Business cases, mainly cost-benefit analysis, are used in all Basis of Design report (CIP Planning). Many business cases are done separately and are used to identify projects for the PWB CIP and for maintenance activities. The PWB has developed a template and application process. Asset management plans include identifying potential business cases and/or project concept report or basis of design report by asset group for the higher risk assets.

**Transportation** PBOT finds this a useful analytical tool, and has applied it to certain projects and proposals. Business case development is a long-term priority.

**Parks and Recreation** PP&R uses established criteria for capital investment decision-making. In the future, the bureau will develop business case analysis for specific project alternatives.
Task #5: Reliability-Centered Maintenance

**Definition**  
Reliability-centered maintenance is an approach to identify the optimal or safe minimum level of maintenance for assets. RCM includes identifying failure modes and maintenance tasks to address those failures before they occur, including preventative and predictive maintenance. An RCM investment strategy can form the basis for calculating a long-term investment profile for an asset type.

**Goal**  
To develop cost-effective maintenance programs for assets to address the main causes of failure and ensure assets continue to perform important functions.

**Desired Outcomes**  
The four participating CAM group bureaus will have identified appropriate maintenance strategies and schedules for high risk assets, based on RCM principles. Bureaus have begun to align maintenance practices as appropriate.

**Approach**  
Application of the reliability-centered approach will occur on a bureau determined basis.

**Interrelationships**  
RCM program should be based on performance measures and risk assessments. These steps should be completed for targeted assets before a full RCM program is developed. RCM should inform a bureau’s long-term investment strategy.

**2012 Status**

**Environmental Services**  
BES will document RCM in response to CMOM (Capacity, Management, Operations, and Maintenance) regulations of the federal Clean Water Act. CMOM products are due by 2013. RCM is already utilized for the treatment system.

**Water**  
The PWB has started a pilot for RCM. Workshop and training for staff have been developed. PWB is working towards reliability-centered maintenance (RCM) for some asset groups. There is an RCM key service level goal in place for the bureau.

**Transportation**  
PBOT uses Streets of Citywide Significance (SCS) to prioritize the right treatment on the right asset at the right time. Knowing there are not enough funds to maintain all infrastructure, SCS prioritizes where the greatest risk of asset failure exists.

**Parks and Recreation**  
PP&R’s approach is asset-specific, focused on optimal operations and maintenance for each asset group.
Task #6: Long-Term Investment Profile

**Definition**
Long-term investment profiles are projections of major maintenance, repair, and replacement needs by asset group based on set service levels over a long-term forecast. By developing long-term investment profiles, bureaus will be better equipped to define funding gaps and identify future needs to maintain a sustainable system.

**Goal**
To project revenue needs for major maintenance, repair and replacement, by asset group, over a long-term forecast.

**Desired Outcomes**
The four participating CAM group bureaus will have collected necessary data, developed tools and methodologies to project investment needs. As possible, bureaus will have identified long-term investment profiles for high risk assets.

**Approach**
The CAM group will share information and research regarding long-term investment profiles. Bureaus will develop tools and methodologies to prepare investment profiles for their assets, as appropriate. Investment profiles will help bureaus determine the optimal mix of operations, maintenance and capital acquisition to achieve lowest long-term system costs.

**Interrelationships**
Development of long-term investment profiles is dependent on setting service levels (Task 1: Service Levels) and on identifying maintenance needs (Task 5: Reliability Centered Maintenance). Work on long-term investment profiles may also inform the 20-year capital project list under development for the Citywide Systems Plan.

**2012 Status**

**Environmental Services**
BES’ work plan does not currently include development of 50-year investment profiles. BES has created remaining life models for pipes. This is complete for collection systems; it is in progress for the treatment plant.

**Water**
The PWB has developed a model to project long-term investment needs. Each Asset Management Plan will include long-term replacement, maintenance and operation cost projections. Currently, data is in a program called Team Plan that needs some data improvements that are being addressed in the AMPs.

**Transportation**
PBOT is in the process of implementing software to conduct trade-off scenarios and budget forecasting for bridges and pavement.

**Parks and Recreation**
PP&R is creating long-term investment profiles by asset group and will then create a PP&R composite profile. PP&R has completed 75-year investment profiles for community and arts centers and pools.
Task #7: Community Information and Consultation

**Definition** Community information and consultation is a key component of a successful AM program. It is necessary to identify appropriate service levels, based on community needs, costs, and ability to pay. In addition, outreach and information can help broaden the base of support for revenues needed to adequately maintain the City’s infrastructure systems.

**Goal** To inform the public about the state of the City’s assets and to improve the public’s understanding of the City’s asset management program and needs. To involve the public at key decision points, including establishing service levels.

**Desired Outcomes** The four participating CAM group bureaus will have had informed community conversations regarding the costs of providing desired levels of service.

**Approach** All four bureaus will continue to consult with the public to help identify investment priorities. The CAM group anticipates that improvements in reporting and information to the public will improve as the tasks of this work plan are completed. However, the CAM group believes that it is particularly critical to have informed community conversations regarding desired levels of service, the cost of providing such service, and resulting investment priorities.

**Interrelationships** In particular, development of tangible performance measures (Task 1); a report card (Task 3); and long-term investment profiles (Task #6) can help the City better describe asset needs to the community.

**2012 Status**

**Environmental Services** BES is scoping public involvement options to discuss asset management of its systems. BES expects to start public engagement by 2014. Also, BES intends to develop a customer service report based on customer service feedback.

**Water** The PWB convenes a budget committee on an annual basis to help identify investment priorities. It has no current plans to discuss service levels with the general public.

**Transportation** PBOT will continue to use its budget advisory committee, which includes citizen members.

**Parks and Recreation** PP&R will continue to use its Parks Board and other venues for public engagement and input. The bureau conducts regular outreach to the community and periodic community surveys to identify priorities and establish service levels.
Progress on Previous Recommendations
In previous years, the Directors’ group endorsed the following major recommendations for citywide AM practices. Progress on these recommendations is also noted below.

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Progress Update</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Improve asset management practices.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Continue with Whole-of-City Approach.</td>
<td>CAM group continues to implement</td>
<td>Ongoing</td>
</tr>
<tr>
<td>b. Review service levels and pursue community consultation.</td>
<td>As part of Portland Plan and Comprehensive Plan update, bureaus are encouraged to set or amend service levels. Each bureau determines its scope, pace and community consultation.</td>
<td>Varies by bureau</td>
</tr>
<tr>
<td><strong>2. Report on asset status and condition.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Continue annual reports and improvements.</td>
<td>This remains a CAM group priority.</td>
<td>Ongoing</td>
</tr>
<tr>
<td>b. Include and distinguish between repair/rehabilitation/replacement, mandate, and capacity-related needs in the annual funding gap.</td>
<td>Starting in 2009, the annual report distinguishes between funding gaps for these various types of needs.</td>
<td>Ongoing</td>
</tr>
<tr>
<td><strong>3. Prioritize infrastructure spending.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Prepare strategies related to service levels, funding allocations, and management practices to align revenues with service levels.</td>
<td>This activity is detailed in the work plan, see Task #1 Service Levels, Task #6 Long Term Investment Profile, and Task #7 Community Consultation.</td>
<td>Future</td>
</tr>
<tr>
<td>b. Track local and regional discussions related to infrastructure financing.</td>
<td>Metro has evaluated infrastructure needs to accommodate projected growth of the region. PDC and the Water Bureau served on the project advisory committee. BPS collected and assembled data from City bureaus, for use in the Metro analysis. The City of Portland adopted Portland Plan and is updating the City’s Comprehensive Plan. Both plans will guide long-term growth and development in Portland. The CAM group is tracking and involved with this process.</td>
<td>Ongoing</td>
</tr>
<tr>
<td>c. Develop a funding strategy to shrink the unmet budget needs for infrastructure maintenance.</td>
<td>Bureaus are individually addressing infrastructure maintenance in the context of available budgets.</td>
<td>Varies by bureau</td>
</tr>
<tr>
<td><strong>4. Integrate with related planning efforts.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>a. Integrate Asset Management into other planning efforts, including community visioning, strategic planning, and long term capital planning.</td>
<td>Asset management will be a key component of the Citywide Systems Plan (part of the Comprehensive Plan).</td>
<td>Ongoing</td>
</tr>
<tr>
<td>b. Track local and regional discussions related to infrastructure.</td>
<td>City staff is tracking local and Metro discussions.</td>
<td>Ongoing</td>
</tr>
<tr>
<td><strong>5. Prepare a plan to guide continued improvement in citywide asset management best practices.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. Identify key gaps based on research into best practices and each bureau’s unique needs.</td>
<td>The CAM group, with the support of an outside consultant, completed research on best practices within peer communities.</td>
<td>Complete</td>
</tr>
<tr>
<td>c. Prioritize improvements necessary to achieve best practices in asset management.</td>

Appendix 2a: Current Condition of Capital Assets

Summary of all Bureaus, December 2012

Dollars in Billions

- Transportation: $8.1 billion
- Environmental Services: $12.5 billion
- Water: $7.1 billion
- Parks and Recreation: $1 billion
- Civic: $1.2 billion

Condition Categories:
- Very good
- Good
- Fair
- Poor
- Very poor
- TBD
Appendix 2b: Current Condition of Capital Assets

Office of Transportation, December 2012

[Bar chart showing the current condition of capital assets across different categories and confidence levels.]
Appendix 2c: Current Condition of Capital Assets

*Environmental Services, December 2012*
Appendix 2d: Current Condition of Capital Assets

Water Bureau, December 2012
Appendix 2e: Current Condition of Capital Assets

Parks Bureau, December 2012

*Other includes: furnishings in natural areas, decorative elements, gathering places, off-leash areas, water play and utilities
Appendix 2f: Current Condition of Capital Assets

*Civic (OMF, Police, Fire), December 2012*

The chart illustrates the current condition of capital assets across various categories, such as Police facilities, Office buildings, Other buildings, PBC facilities, Spectator facilities, Fire facilities, Communications, Production services, Electronic equipment/software, Strategic technology, and PCPA. The condition ratings are categorized as Very good, Fair, Good, Very poor, and TBD. The chart shows the percentage of assets in each condition rating category, with confidence levels indicated.

**R/R/R (Repair, Rehabilitation, Replacement):** Additional funding necessary to repair, rehabilitate and replace existing assets to bring them up to established service levels, or replace assets considered functionally obsolete (not meeting those service levels).

**Mandate:** Additional funding necessary to improve existing assets to meet regulatory requirements, exclusive of improvements that fall under R/R/R or Capacity.

**Capacity:** Additional funding necessary to address existing inequities and deficiencies in levels of service for current customers and citizens.

Spectator Facilities and Union Station fund gaps are of a one-time nature: $45M for Union Station renovation and $35M for Spectator facilities reserves funding. OMF is beginning to work with Metro/ MERC on the status of PCPA facilities.
Appendix 4: Data Confidence Level Summary

Citywide, December 2012

Data Confidence Level Summary by Asset Value

1 Current Condition is to be determined for parks furnishings in developed parks.

2 Annual Funding Gap is to be determined for transportation support facilities and the Portland Center for the Performing Arts.
Appendix 5: Definitions

The following definitions and confidence levels draw on several AM sources, including GHD Consultants (used by the Water Bureau and PBOT), trained bureau staff, and literature searches.

**Asset**
A physical component of infrastructure or a facility which has value and has an expected useful life of more than one year, that would be replaced if destroyed, and is not surplus to needs.

**Asset Management**
The continuous cycle of asset inventory, condition, and performance assessment that has as its goal the cost-effective provision of a desired level of service for physical assets. Investment decisions consider planning, design, construction, maintenance, operation, rehabilitation, and replacing assets on a sustainable basis that considers social, economic, and environmental impacts.

**Backlog**
The sum of deferred activities, such as maintenance, operations, and rehabilitation, needed to achieve the lowest life-cycle cost for an asset. Backlog results from lack of money, materials, or staff to perform the needed work. (See Funding Gap.)

**Capital Expansion**
Projects or facilities that create new assets, increase the capacity of existing assets beyond their original design capacity or service potential, or increase the size and service capability of a current service area, including service to newly annexed, undeveloped, or under-served areas. Generally increases the total maintenance requirements because it is increasing the total asset base.

**Civic**
A collection of City-owned assets, including facilities (office, police, fire, parking garages, spectator facilities, Portland Center for the Performing Arts) and technology services (800 MHz radio system, telecommunications, IT operations, strategic technology). Bureau maintenance facilities are assets of the operating bureau.

**Condition Assessment**
The method used to quantify the deterioration rate and remaining useful life of an asset. Methods of condition assessment vary by asset classification and range from use of industry estimates for deterioration rates up to documented physical inspection regimens on established cycles that ensure optimum economic life of an asset.

**Condition Measure/Rating**
A means of classification using information from periodic inspections or measurements to indicate the ability of an asset to deliver a particular level of service.

**Confidence Levels**
The expression of accuracy and reliability in the areas of information (source and reliability), process (ad hoc or repeatable) and documentation (documented or not documented).

### Confidence Levels in Data and Information

<td>No confidence</td>
<td>No inventory</td>
<td>No assessment method</td>
<td>No process</td>
</tr>
<tr>
<td>Low confidence</td>
<td>Partially complete inventory</td>
<td>Estimates used to assess condition</td>
<td>Process not well documented</td>
</tr>
<tr>
<td>Moderate confidence</td>
<td>Inventory complete</td>
<td>Subjective process to estimate condition estimated followed on a regular schedule</td>
<td>Some documentation in place</td>
</tr>
<tr>
<td>High confidence</td>
<td>Inventory complete</td>
<td>Condition surveys conducted on a regular schedule by well-trained personnel</td>
<td>Well documented process followed</td>
</tr>
<tr>
<td>Optimal confidence</td>
<td>Inventory complete</td>
<td>Condition surveyed on a regular schedule</td>
<td>Objective process followed; Accuracy of data verified and well documented</td>
</tr>
</tbody>
</table>
**Consequence of Failure**  The outcome of an event expressed qualitatively or quantitatively, being a loss, injury, disadvantage or gain. There may be a range of possible outcomes associated with an event. There may be economic, social and/or environmental consequences of asset failure.

**Critical Infrastructure**  Infrastructure assets that are essential for the functioning of society and the economy, including energy generation, transmission and distribution; telecommunications; water supply and wastewater; transportation systems; public health; and security and emergency response services.

**Current Replacement Value (CRV)**  The CRV is the total cost to replace the entire asset to meet current accepted standards and codes.

**Failure Mode**  The reason why an asset failed to provide the function for which it was installed.

**Funding Gap**  The difference between the funding needed to address infrastructure needs of an asset at a defined condition or level of service and the funding that is currently available. The funding gap varies with the funding level and affects the level of service. The funding gap is the amount of money needed to eliminate the backlog and/or maintain the asset to achieve its useful life. Given a certain funding level, the resulting level of service can be forecast; if a certain level of service is desired, the funds needed to achieve it can be estimated. There are three types of funding gap:

- **Repair, Rehabilitation, Replacement**: Additional funding necessary to repair or rehabilitate existing assets to bring them up to current service levels, or replace assets considered obsolete.
- **Mandate**: Additional funding necessary to improve existing assets to meet regulatory requirements, exclusive of improvements that fall under Repair, Rehabilitation, Replacement or Capacity.
- **Capacity**: Additional funding necessary to address existing inequities and deficiencies in levels of service for current customers and citizens.

**Green Infrastructure**  Infrastructure that uses natural processes, systems, or features to provide traditional infrastructure services. There are two types of green infrastructure:

- Natural networks of streams, rivers, and open spaces that naturally manage stormwater, provide habitat, improve air and water quality, reduce flooding risk, and provide areas for human recreation and respite; and
- Engineered facilities, such as green street treatments or eco-roofs, which use natural processes in an infrastructure setting.

**High-risk Infrastructure**  Infrastructure assets that have a high risk of failure, based on the likelihood and consequence of that failure.

**Infrastructure**  Consists of assets in three general networks that serve whole communities — transportation modalities (roads, rail, etc.), utilities and parks. These are necessary municipal or public services, provided by the government or by private companies and defined as long-lived capital assets that normally are stationary in nature and can be preserved for a significant number of years. Examples are streets, bridges, drainage systems, water and sewer lines, pump stations and treatment plants, community centers and pools, and police and fire stations. Beyond transportation and utility networks, Portland includes parks, buildings, green infrastructure, communications, and information technology as necessary infrastructure investments that serve the community.

**Inventory**  A list of assets and their principal components.
Level of Service
A defined standard against which the quality and quantity of service can be measured. A level of service can include reliability, responsiveness, environmental acceptability, customer values and cost.

Life-Cycle Cost
The sum of all costs throughout the life of an asset, including planning, design, acquisition, construction, operation, maintenance, rehabilitation/renewal and disposal costs.

Likelihood of Failure
The probability or possibility of an event that will cause the asset to fail.

Maintenance
Activities that keep an asset operating as designed or prevent it from deteriorating prematurely, excluding rehabilitation or renewal which may extend asset life. Maintenance can be planned or unplanned. Planned maintenance is:
- Preventive maintenance conducted at regular scheduled intervals based on average statistical/anticipated lifetime.
- Condition-based maintenance based on objective evidence of need from tests, measurements and observations.
- Deferred — the shortfall created by postponing prudent but nonessential repairs to save money or materials. Generally, a policy of continuing deferred maintenance results in higher costs when repairs are eventually made, or failure that occurs sooner than if normal maintenance had been performed.

Unplanned maintenance is:
- Reactive or Emergency-corrective actions taken upon failure or obvious threat of failure, usually at a higher cost than planned or preventive maintenance.

Operations
The ongoing activities that allow the use of an asset for its intended function.

Performance Indicator
A qualitative or quantitative measure used to compare actual performance against a defined standard. Indicators are commonly used to measure cost, performance, or customer satisfaction.

Performance Monitoring
The periodic assessments of actual performance compared to specific objectives, targets, or standards.

Rehabilitation/Renewal
Maintenance performed on an asset to restore it to its original level of service or capacity and achieve its useful life, which may result in an extension of the asset's service life.

Retirement/Removal
Decommissioning or removal of an asset through disposal, abandonment, demolition, or sale that may involve retiring deteriorated assets and recovering salvage value.

Risk
The chance of something happening that will have an impact upon objectives. Risk is measured in terms of likelihood and consequences.

Risk Analysis
A systematic use of available information to determine how often specified events may occur and the magnitude of their consequences.

Risk Management Strategy
The systematic application of management policies, procedures and practices to the tasks of establishing the context, identifying, analyzing, evaluating, treating, monitoring and communicating risk.

Triple Bottom Line
A method to categorize the benefits and impacts an organization can expect from investing in its assets. The benefits are categorized into Social, Economic, and Environmental benefits to ensure a comprehensive evaluation in the decision-making process (measure, manage and report).

Useful Life
The period of time over which an asset is expected to deliver efficient service with normal or appropriate maintenance (defined as accepted industry standard or documented local experience).
